VERTIGO

safretti®

Safretti flueless fireplaces have a unique design and a high-quality finish. A combination of exclusive design and the warmth of fire. The flueless fireplaces are easy to attach to the wall or to place in open spaces. The open fire will be created by using a special liquid (bio-ethanol). A flue is not necessary.

Due to the high-quality materials used, these fireplaces are suitable for use both inside and outside on the patio or balcony. Safretti stands for Stylish, Modern, Trustworthy and Design.

Safretti designs and fabricates sustainable design ecofireplaces. Not in a production line, but on the basis of pure craftsmanship. And we are led in this by our desire to innovate. Safretti breaks through customary production processes and takes a second look at materials and their possible applications.

A simple philosophy, but one that has proven very successful.

safretti[®] VERTIGO

Vertigo leans naturally against the wall and when switched off forms a modest architectural element. It springs to life when the flames are switched on by the remote control and the protective glass is raised. Normally the glass screen is lowered out of sight when the fireplace is switched off. More info at: safretti-vertigo.com.

Dimensions:

108 x 60 x 20 cm (H x W x D)

Weight:

45 kg

Fuel tank:

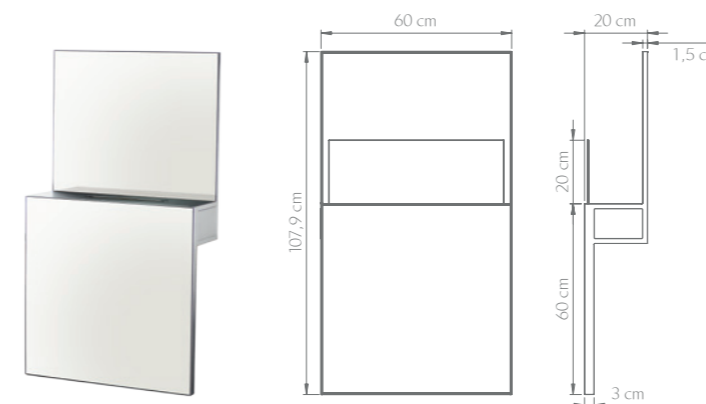

2 ltr.

Colours:

black, white or Mirror

Vertigo features:

- Unique, safe burning system for bio-ethanol that has been patented worldwide.
- Fuel tank cannot be topped up whilst the fire is burning.
- Closed, separate tank system.
- Electronic ignition by remote control, so no separate lighter required.
- Crash-test resistant as a result of the automatic emergency stop.
- Meets the very latest international standards.
- Designed by one of the most famous design studios in the world.
- Made in Holland.

Safety first

Vertigo is equipped with the revolutionary LUN Safeburner® system. The LUN Safeburner® offers comfort functions such as start/stop and regulation of the flame using a remote control.

Thanks to its 2-litre fuel tank it can burn for a long time without having to be refilled. It also has safety features such as a tilt sensor, CO2 sensor, temperature sensor and overfill sensor. The tank is completely separate from the burner; the ethanol is pumped up from the tank to the burner. The burner itself holds just a minimum amount of ethanol and the fireplace therefore reacts instantly when you regulate the size of the flame.

Also there is no ethanol left in the burner when it is stopped. The flame is clean and odourless. The burner furthermore has mechanical systems that will ensure that no dangerous situation can occur in the unlikely event that the electronic systems should fail.

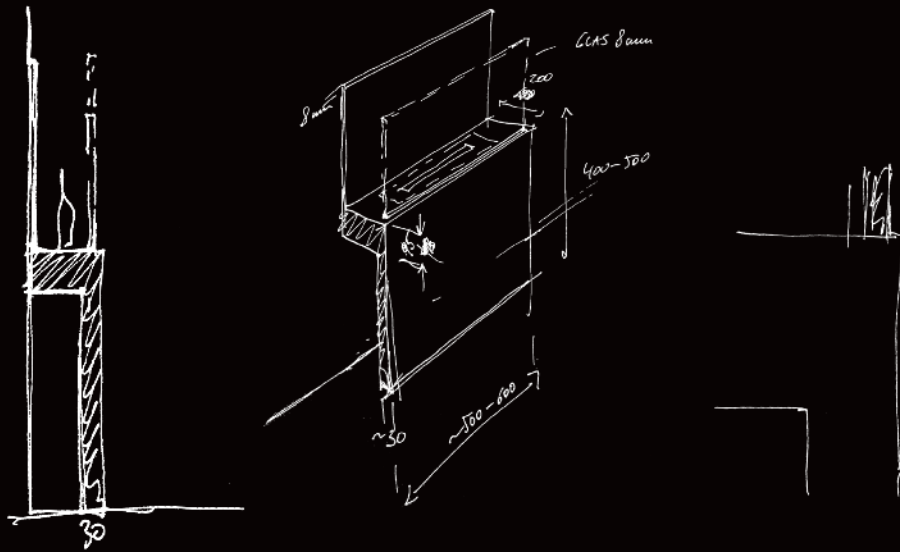

The LUN Safeburner® thus meets the latest safety standards.
